How to run the chisubmit REST server for development

```bash
git clone https://github.com/uchicago-cs/chisubmit.git
git checkout -b my_dev_branch origin/backend
src/chisubmit/backend/webapp/db_create.py
src/chisubmit/backend/webapp/run.py
```

It is likely to die for lack of python modules. Use a virtualenv and include these modules and their dependencies:

- flask
- flask-sqlalchemy
- python-ldap
- wtforms_json
- pytz
- python-dateutil
