

PIP (Python Modules)

Installation

These are general guide lines and not hard and fast rules.

The recommended method of installing via pip is:

```
python[3] -m pip install --user <somepackage>
```

System Wide

Installing python modules system wide is normally done when a larger group of people need a particular module.

As a normal user

This is the recommended method of installation. I will refer you to pip 's --user option install any python module under your user account. These will be installed under \$HOME/.local.
