Git Repositories from Rosters

The Repo Automations is mostly an invisible and simple process that tries to stay out of the way. It creates git repositories for students, graders and instructors.

This service is a good option for previous users of `phoenixforge`. Git repositories are automatically created from course repository data with optional ability for you to override memberships, repository names, permissions, and more.

To get started, write techstaff@cs.uchicago.edu, and let us know which course you would like to automate.

For a full introduction, and for current users, see Gitlab Roster Usage.
